

Population Density

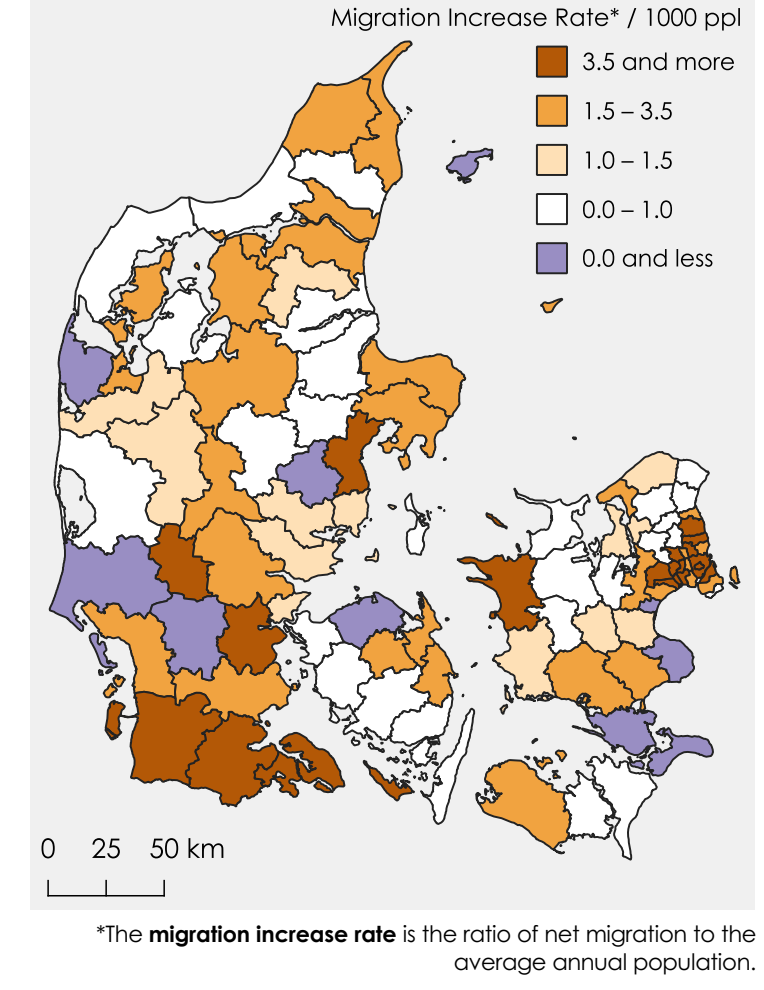

Natural Increase

The population of Denmark is around 5.9 million people. Population density is highest in the Copenhagen metropolitan area, while rural areas are less densely populated.

Migration Increase

Natural increase is low due to a stable birth rate and low mortality. The country is experiencing population aging, as seen in the population pyramid, where the proportion of elderly people is increasing.

Migration growth also contributes to population growth, especially from EU countries and beyond, influencing the social and age structure of the population.

Denmark has a high life expectancy (around 81 years) which impacts the age structure. Declining birth rates and a growing elderly population pose demographic challenges for the economy and social system.
